Surgical Care

 $\label{thm:constraints} \mbox{Hospitals can reduce the risk of infection after surgery by making sure they provide care}$ that's known to get the best results for most patients. Here are some examples:

- · Giving the recommended antibiotics at the right time before surgery

- Stopping the antibiotics within the right timeframe after surgery
 Maintaining the patient's temperature and blood glucose (sugar) at normal levels
 Removing catheters that are used to drain the bladder in a timely manner after surgery.

Hospitals can also reduce the risk of cardiac problems associated with surgery by:

- Making sure that certain prescription drugs are continued in the time before, during, and just after the surgery. This includes drugs used to control heart rhythms and blood
- Giving drugs that prevent blood clots and using other methods such as special stockings that increase circulation in the legs.
- More information about timely and effective care measures.
- Why surgical care measures are important.
 Current data collection period.

Emergency Department Care

Timely and effective care in hospital emergency departments is essential for good patient outcomes. Delays before receiving care in the emergency department can reduce the quality of care and increase risks and discomfort for patients with serious illnesses or injuries. Waiting times at different hospitals can vary widely, depending on the number of patients seen, staffing levels, efficiency, admitting procedures, or the availability of inpatient beds.

The information below shows how quickly the hospitals you selected treat patients who come to the hospital emergency department, compared to the average for all hospitals in the U.S.

- · More information about timely and effective care measures.
- Why emergency department care measures are important.
 Current data collection period.

Timely Emergency Department Care

Healthcare-Associated Infections

Healthcare Associated Infections are reported using a Standardized Infection Ratio (SIR). This calculation compares the number of Central Line Associated Bloodstream Infections (CLABSI) in a hospital intensive care unit or Surgical Site Infections (SSI) from operative procedures performed in a hospital to a national benchmark based on data reported to NHSN from 2006 – 2008. Scores for Catheter Associated Urinary Tract Infections (CAUTI) are compared to a national benchmark based on data reported to NHSN in 2009. The results are adjusted based on certain factors such as the type and size of a hospital or ICU for CLABSI and CAUTI, and based on certain factors related to

the patient and surgery that was conducted for SSI. Each hospital's SIR is shown in the graph view.

- A score's confidence interval that is less than 1 means that the hospital had fewer infections than hospitals of similar type and size.
- · A score's confidence interval that includes 1 means that the hospital's infections score was no different than hospitals of similar type and size.
- A score's confidence interval that is more than 1 means that the hospital had more infections than hospitals of similar type and size.
- Why Healthcare Associated Infections (HAIs) measures are important.
- Current data collection period.

Readmissions, Complications and Deaths

Patients who are admitted to the hospital for treatment of medical problems sometimes get other serious injuries, complications, or conditions, and may even die. Some patients may experience problems soon after they are discharged and need to be admitted to the hospital again. These events can often be prevented if hospitals follow best practices for treating patients.

30-Day Outcomes Readmission and Deaths

30-Day Readmission is when patients who have had a recent hospital stay need to go back into a hospital again within 30 days of their discharge. Below, the rates of readmission for each hospital are compared to the U.S. National Rate. The rates take into account how sick patients were before they were admitted to the hospital.

30-Day Mortality is when patients die within 30 days of their admission to a hospital. Below, the death rates for each hospital are compared to the U.S. National Rate. The rates take into account how sick patients were before they were admitted to the hospital.

- More information about Hospital Readmission and Mortality Measures.
